

Forensic Statistics (Robert J. Ollis, Jr., Spectre Scientific)

Many scientists have taken statistics, as well as many from all other disciplines in the job market. But how does the application of statistics improve our ability to demonstrate the veracity of our conclusions? How do we testify to these statistics? More importantly, what can we say and what shouldn't we say about these important tools when reporting, consulting, and testifying? How does measurement uncertainty affect our results and how do we know we are doing it correctly? This and many other topics will be covered in this workshop.
